

If you do have the correct settings, but still not see this page, click [here](#).

By using the excellent combination of *swfObject* and *swfAddress* you can actually send your friends, co-workers, clients and everybody else links to specific sections of your website!

It's always easy if you can jump from page to page with a single click, so there is an option in the template that lets you trigger internal links from a simple HTML link.

- Click

Proper browser integration is also provided by `swfAddress`, so even those visitors who love their browser buttons more than their own children can still work with this website without getting confused and whatnot.

**+ Link away!**

### + Play that tune!

The mp3 player can either use PHP to browse a directory for MP3 files or use an XML file in which you can specify which files to play (files included).

You can set it up to play or hold on load, you can have a random song start and if you hate music all together you can just leave off the entire mp3 player with a single variable in the XML file.

If you're still wondering where the mp3 player is, check the second button from the top right and have some fun with it!

Indeed, the eq bars are fake, but at least they have a random height and adjust in height according to the volume.

### + Smart volume control.

If a user adjusts the volume of the mp3 player, the value will be stored in his/her browser, so the mp3 player will start playing again at the set volume when they re-visit your site.

Okay, it's actually not that big a deal, but if you were wondering why the volume on this site reacts differently then most, you now know the answer to that question!
